

safety

How we should Communicate...

...in order of effectiveness.

- 1 **Safe act observation**
Job/Procedure Review
- 2 **Safety unit meetings**
Crib Room Talks
Supervisor / management / weekly / monthly / in-charge meetings
Safety training programs
Project team meeting
- 3 **Safety committee meetings**
Union meetings
- 4 **Designated safety talk**
- 5 **Joint working party**
- 6 **Safety communication feedback meeting**
- 7 **Mine site briefing**
- 8 **Direct mail**
Lamp letter
Signed letter
Statutory reports
- 9 **Special noticeboard**
- 10 **News Fax**
Noticeboards
Significant incident report (distribution process)
Safety cards
Occupational health newsletters
Coal News
Site newsletter
OHS videos
Accident/incident investigation

Examples of the way we should be using more often

Two way communication is possible here

One way communication is only possible here

INTRODUCTION

Warning and Remember icons will appear throughout this hand book as shown below and MUST ALWAYS be adhered to or the application thereof.

WARNING

Indicates an action or condition that, if not followed, could cause injury to personnel or equipment.

REMEMBER

Indicates a procedure or condition that is essential for the operator to know.

INTRODUCTION

Appin Colliery Collieries Division

VISION ➤ To be the world's best supplier of coking coal.

MISSION ➤ To provide...

a sustainable competitive advantage to BHP Collieries Division,

and,

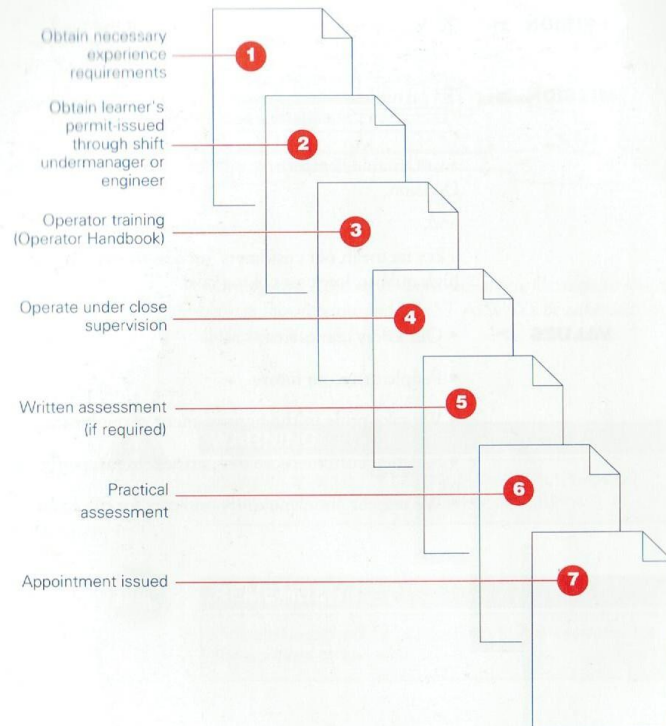

a key factor in our customers' success through the supply of high quality, low cost coking coal.

- VALUES** ➤
- Our safety comes first.
 - People drive our future.
 - We take pride in the improvement of our business.
 - Satisfied customers are our partners in prosperity.
 - We respect our community and care for the environment.

Training Steps

Steps to Authorisation

Dealing With Hazards

Working at a Drill Site

HAZARDS

The hazards associated with working at a drill site are:

- Accumulation of oil or grease.
- Loose material, tools, hoses or cables.
- Loose coal ribs or roof stone.

To minimise the risk of injury from these hazards the operator should:

- Clean/hose down surfaces/floor/work area to remove any accumulations of oil or grease.
- Pick-up and make safe loose material underfoot, and tie up hoses and cables.
- Store loose tools & materials. Tidy and clear walkways.
- Place refuse in garbage bags.
- Stonedust the work site to improve visibility.

REMEMBER

It is Colliery standard to clean and level a drill site during the set up procedure.

This can be done by using a Domino with a bucket attachment, shovel, or if necessary, picking up the loose material by hand.

- Scale down loose rib and roof material.

- Sound the roof & rig to ensure integrity.

- Install additional support if required.

Hazards Produced by Drilling

The hazards caused by drilling are:

- Seam gas released into the work area.
- Accumulated waste water on walkways and transport roadways.
- Waste water accumulates in the suction range.

To minimize the hazards produced by drilling and to ensure efficient coal seam drainage, the Colliery has developed a list of standards that should be observed at all drill sites.

IMPORTANT ➤

- Whilst drilling and whilst the hole is standing to be drilled further, suction should be applied to the hole through a stuffing box. This should be regulated to draw off the gas as it is produced from the hole, without drawing water or excessive air into the range.
- Since waste water is or causes a hazard, it must be contained near the drill site by a stonedust dam or a gas/water separator or both. A pump should be used to pick up the water and discharge it into the waste water range. The district supervisor will confirm if a pump **DOES NOT** need to be used.

Operator Responsibilities

When a hazard is recognised, stop drilling & take the necessary action to remedy the hazardous situation whether it be a defect in the drilling machine, ventilation or excessive gas emissions from the hole or instability in the roof and rib. Only recommence after the hazard has been removed.

REMEMBER

It is the responsibility of the employee to rectify a hazardous situation if it is within their ability or report the hazard to a supervisor or engineer.

If an employee is unable to rectify a hazardous situation, or is working on a machine to remedy a defect, consider the appropriate safety tag should be attached.

PERSONAL DANGER TAG

Personal Danger Tags are to be completed, signed and attached to switches, valves etc... by the person who would have been in danger by the operation of that switch or valve. (e.g. repairs or maintenance).

REMEMBER

- YOU fill it out
- YOU put it on
- YOU remove it
- YOU destroy it

REMEMBER

Personal Danger Tags can only be removed by the person whose name appears on the tag, except in extra ordinary circumstances

OUT OF SERVICE TAG

Out of Service Tags are to be completed, signed and attached to equipment that is unserviceable or withdrawn from service.

PERSONAL DANGER TAG

OUT OF SERVICE TAG

Front

Back

INFORMATION TAG

INFORMATION TAG

THIS TAG **MUST NOT** UNDER ANY CIRCUMSTANCE BE USED AS A SUBSTITUTE FOR A DANGER TAG OR AN OUT OF SERVICE TAG.

TAG PLACED BY: _____

DEPARTMENT: _____

DATE: _____ TIME: _____ a.m.
p.m.

MESSAGE: _____

This tag should be used at all times when information needs to be passed on to others concerning equipment, Core N^o, survey holes or any general information, and should be used at the completion of each hole indicating hole N^o, length of hole, completion date and any other relevant information.

Signs

Signs which show Methane values, pipe lines & water traps. (Figure 1)

Use of a Methane Detector

The Manager has stipulated additional rules for the use of an automatic Methane Detector (A.M.D.) at a drill site. QS-ACM-SP030.

(Figure 2). Use of Methane Detector (Mentor)

 BHP		Aglin Colliery Collieries Division BHP Steel
STANDARD PROCEDURE		
DEPARTMENT: MINING		
TITLE OF STANDARD:		
ADDITIONAL MANAGER'S RULES		
USE OF AUTOMATIC METHANE DETECTORS FOR UNDERGROUND GAS DRAINAGE DRILLING OPERATIONS		
ORIGINATOR: S Lowe	AUTHORISATION:	
AUTHORISER: S Lowe		
TITLE: Mine Manager		
<ol style="list-style-type: none"> Whenever gas drainage drilling operations are being carried out, an automatic methane detector must be used. This requirement applies to ALL drilling operations whether the drill rig is powered by an electro-hydraulic power pack or by compressed air. The automatic methane detector shall be positioned in the upper third of the hole on the return side of the mouth of the hole being drilled. The automatic methane detector shall be designed to give an audible and/or visual alarm at 1% CH₄. Upon an alarm warning being given, the following rules shall apply to the drill rig operators: <ol style="list-style-type: none"> All drilling operations shall cease immediately Where applicable, power shall be removed from the power pack The alarm shall be reported, as soon as practicable, to a mining official Drilling operations may not recommence until a Deputy or Senior Mining Official has inspected the area and found it safe to do so If the automatic methane detector is not present or becomes ineffective for any reason, drilling operations shall not be carried out. A person to whom an automatic methane detector is issued, shall ensure that it is kept free from damage and returned to the lamp room at end of shift. A book (register) shall be kept in the lamp room to record the issue of automatic methane detectors.

<p>Note: If the readings vary from those shown above check with the lamp cabin officer that they are within the required tolerances.</p>											
ALARM READING											
<table border="1" style="width: 100%; text-align: center;"> <tr> <td>COppm</td> <td>O2%</td> <td>CH4%</td> </tr> <tr> <td>50ppm</td> <td>19%</td> <td>1%</td> </tr> </table>			COppm	O2%	CH4%	50ppm	19%	1%	<p style="text-align: center;">CH4 ALARM MACHINE. TO BE WITHDRAWN AT 1%</p> <p style="text-align: center;">CH4 ALARM MACHINE. TO BE STOPPED AT 1.25%</p> <p style="text-align: center;">AT 19% O2 THE MACHINE IS STOPPED</p> <p style="text-align: center;">AT 50PPM CO THE MACHINE IS STOPPED</p>		
COppm	O2%	CH4%									
50ppm	19%	1%									
IMPORTANT.											
You must report without delay any of the above alarms to a mining official.											

Communication

Since drill operations are an ongoing process, it is imperative to pass information from one shift to the next to ensure that the oncoming operators are aware of:

- Objectives for a given shift.
- Environmental hazards.
- Machine status.
- Drilling status.
- Materials inventory.

To facilitate this process, it is necessary for:

- The drill operators to talk to each other at change of shift,
- The drill operators to talk to the drilling supervisor and,
- The drilling supervisors to talk to each other at the change of shift.

It is important that the oncoming shift has the best information available. So, if the operator can communicate this to the next shift before they leave the surface, improvements in drill site management can occur.

Additionally, the check-list (figure 5 pg 22), "Drill Site Check List", can be used to ensure all necessary information is collected and passed on, and any deficiency highlighted.

Drill Site Check-list for : D.R. at:

item	checked OK	reqd. amt
inspection by mine official		
worksite levelled and free from loose material		
compressed air to the site		
mains water to the site		
suction to the site		
waste water managed		
dam /pump in place		
valves/camloc/fittings		
standpipe		
grout ,plaster		
suction hose		
conduit		
safety relief valves		
drill rig		
power pack		
water pump		
drill rods		
grout mixer and wand		
grout pump		
inclinometer		
mixing drum		
venturi		
2 x stilsons		
reamer for standpipe		
serviceable drill bit/reamer		

(Figure 5). Drill Site Check List (uncontrolled copy)

The Shift Drilling Report

The Shift Drilling Report is filled in to update the Methane Drainage Department in regard to site progress and site requirements. Drill operators can refer to the copy on-site to determine the history of the hole or drill site.

Since each rod is logged on this report by the operator, the report becomes an important document to Management in helping determine the potential outburst risk of a given area in the case of in-seam drilling, and to help determine the most efficient drilling method and penetration of cross-measure holes.

It is a requirement of the Colliery's Outburst Management plan that:

"Holes drilled for the purpose of in-seam gas drainage and/or gas data collection will be drilled as per assessment for "Cross measure or In-seam Drilling". (QS-ATC EA 001 & QS-ATC EA 006)"

Shift Drilling Reports will include the following data:

- Date of drilling.
- Cutting colour.
- Drilling conditions.
- Number of rods used.
- Detail of drilling anomalies (e.g. bogging, high gas emission, water loss, water emission, lumps of coal ejected, mylonite).

- Panel
- Drill Rig N^o
- Drillers Name
- Hole identification number and location
- All delays encountered during shift to be recorded with times
