# *Multi longwall & district or whole mine gas emission versus time*

# Multi longwall extraction & closed mine gas emission decline curves

*Selected  
district  
gas  
emission  
& goaves  
decline  
curve*

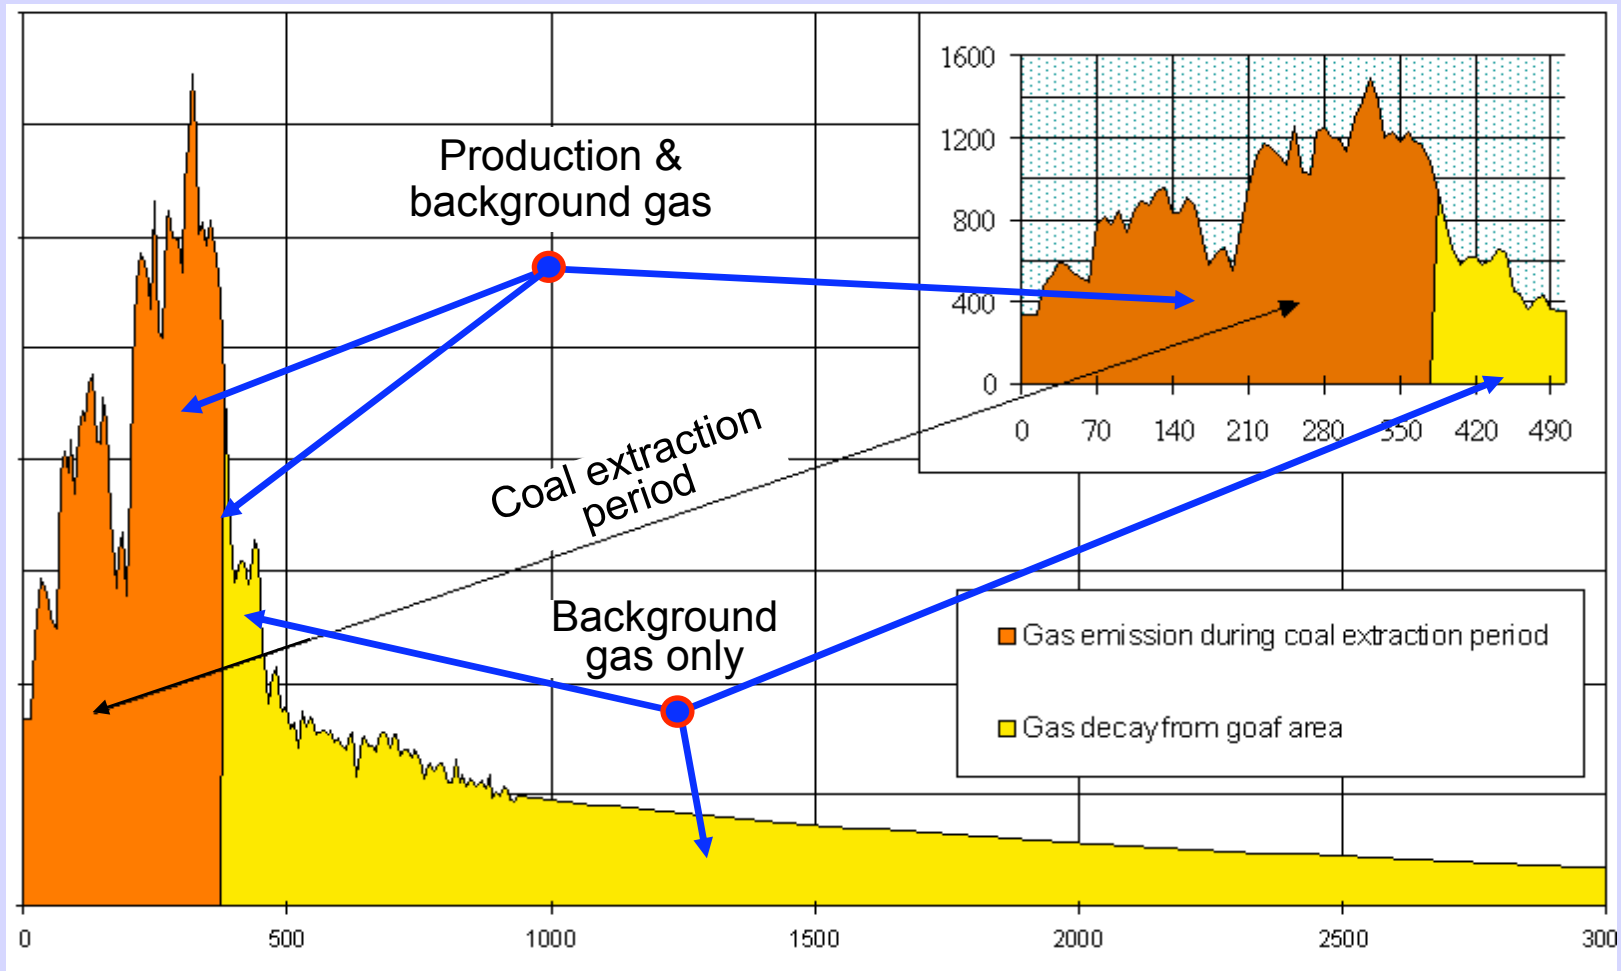

## *U/G gassy coal mines classification*

<b>Classification</b>	<b>Mine entries and surface boreholes</b>	<b>Ventilation</b>	<b>Coal production</b>	<b>Water pumping</b>	<b>Responsibility</b>	<b>Time</b>
<b>Temporary closed</b>	<b>Opened, not permanently or partially sealed</b>	<b>Operating on reduced capacity</b>	<b>Ceased Possible future production</b>	<b>Optional</b>	<b>Mine operator (maintenance)</b>	<b>Not a factor</b>
<b>Closed</b>	<b>Partially or fully sealed</b>	<b>Optional</b>	<b>Ceased No future production</b>	<b>Terminated Goaves gradually flooding</b>	<b>Mine operator</b>	
<b>Decommissioned</b>	<b>Permanently sealed</b>				<b>Transferred from mine operator to the relevant Government Authority</b>	<b>1-20 years Once transfer occurs</b>
<b>Abandoned</b>						
<b>Sealed longwall or district</b>				<b>Optional</b>	<b>Mine operator</b>	<b>Not a factor</b>

# Production & background gas emission

# CMGGP formulae for rapid and long term decline curves

## Stage 1. Production & background gas

Up to 12 months

*The logarithmic approximation curve*

$$Q = -A * \text{Ln} (\text{Time}) + B$$

---

## Stage 2. Background gas only

Up to 30 years

*The exponential approximation curve*

$$Q = C * e^{-D * (\text{Time})}$$

---

Mathematical equation coefficients

- A - Gas emission decay rate
- B - Gas emission initial magnitude & strata permeability
- C - Gas reservoir capacity & characteristics
- D - Rate and quickness of decline

# CMGGP formulae for long term background methane decline curve

$$F(x) = a * e^{-b*x}$$

Where:

$x$  - time (months)

$a$  - quantity constant

$b$  - decline constant, or

$$BM_{DE} = BM_{IN} * EXP(-b * months)$$

Where:

$BM_{DE}$  - Background methane decline emission (methane make)

$BM_{IN} = MM_F * BM_{CC}$  - Background methane initial quantity (3 -12 months after ceases coal production)

$MM_F$  - Mine methane final (1 month before ceases coal production)

$AT$  - Annual tonnage (last 5 years average coal production)

$BM_{CC}$  - Background methane contribution coefficient (either related to the annual coal production and/or various mine categories geological & mining conditions)

Cat I & II =  $c * AT^{-d}$

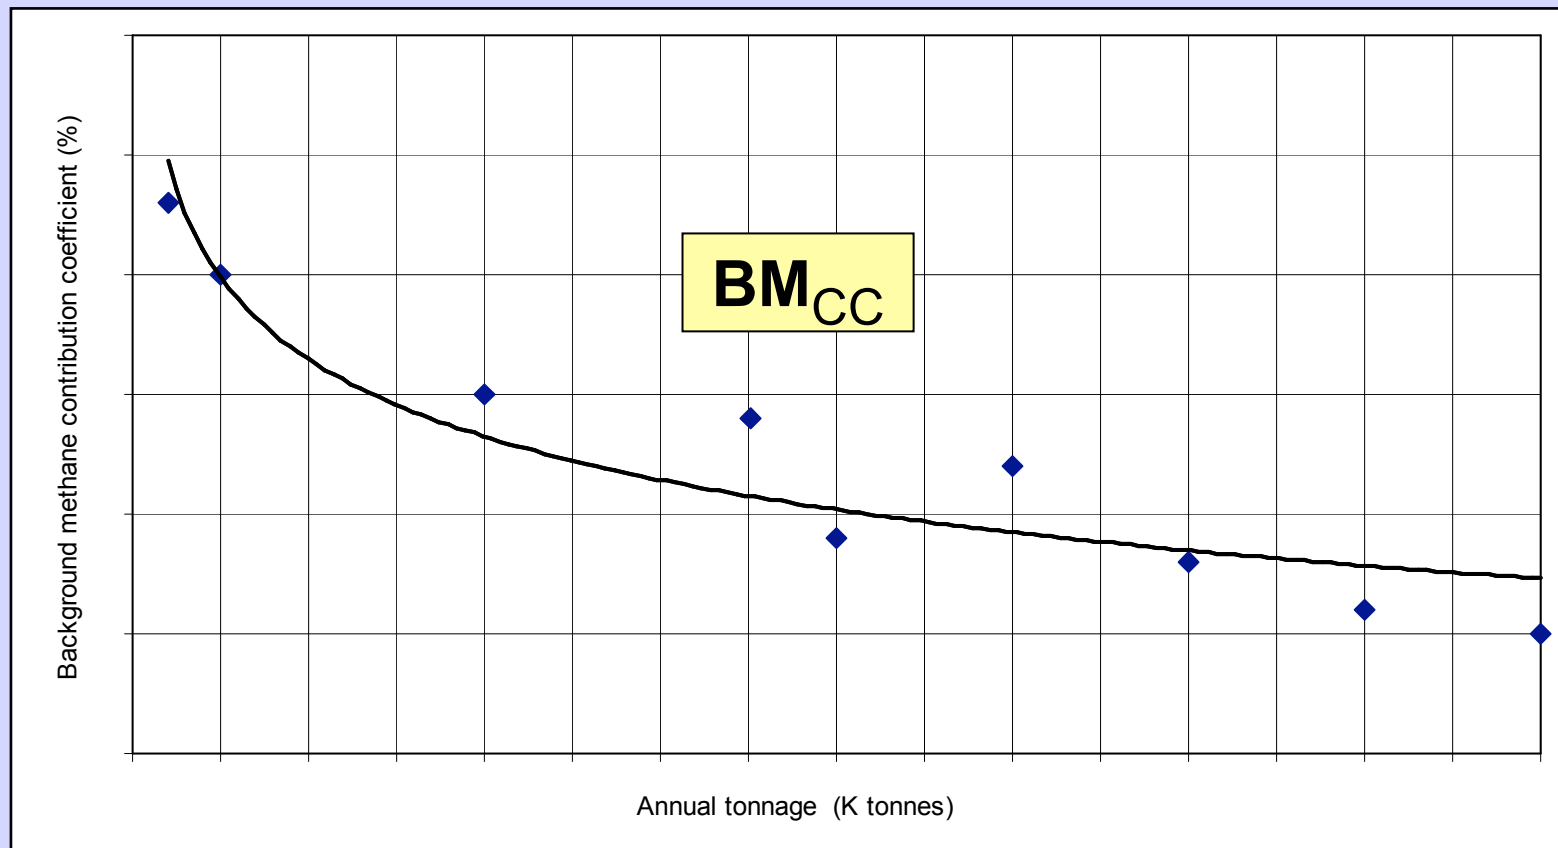

Cat III, V & VIII =  $e$

Cat IV, VI & VII =  $f$

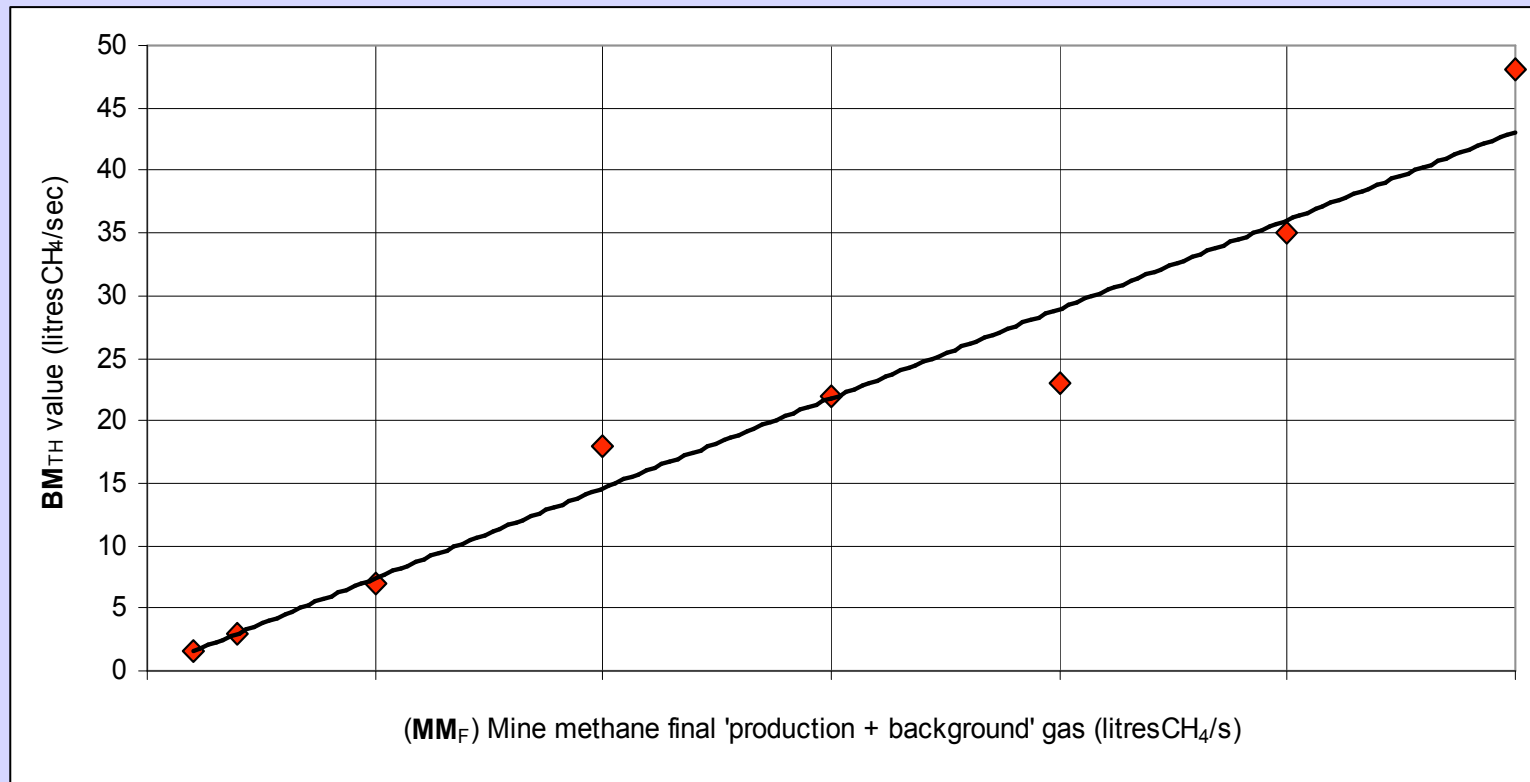

# Background methane contribution coefficient vs last 5 years annual tonnage

# Background methane threshold $BM_{TH}$ vs dry mine methane final $MM_F$

## *GRM software simulation sequence*

### **Two stages of coal mine gas quantity decline phenomenon**

- **PRODUCTION gas** - rapid decline phase
- **BACKGROUND gas** - slow/long term decline phase

### **Outputs: Gas emission decline curve**

- **DRYSIM** - Dry mine gas decline rate vs time and,
- **WETSIM** - Flooded mine gas decline rate vs time

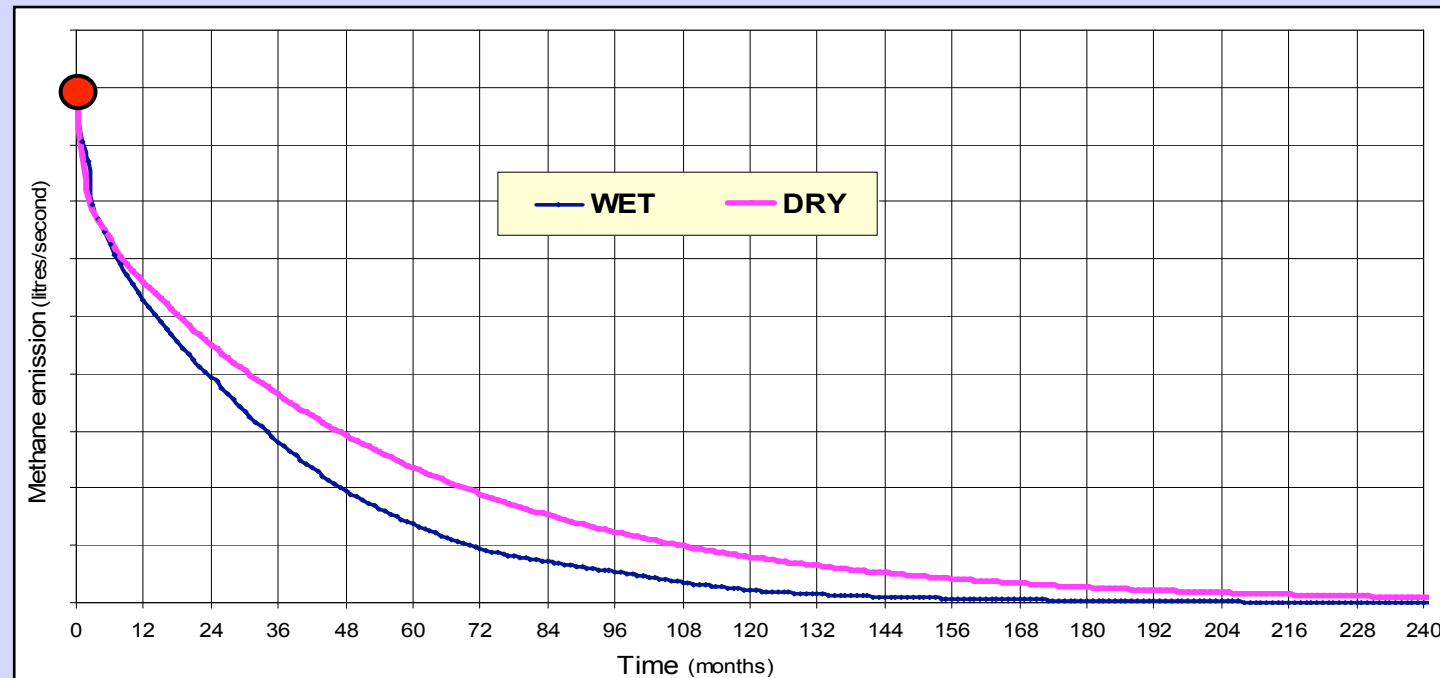

# *WETSIM curve concept using zero methane emission*

**Gas emission will be zero when the mine is finally flooded and the time when this occurs is estimated from the void and water inflow data.**

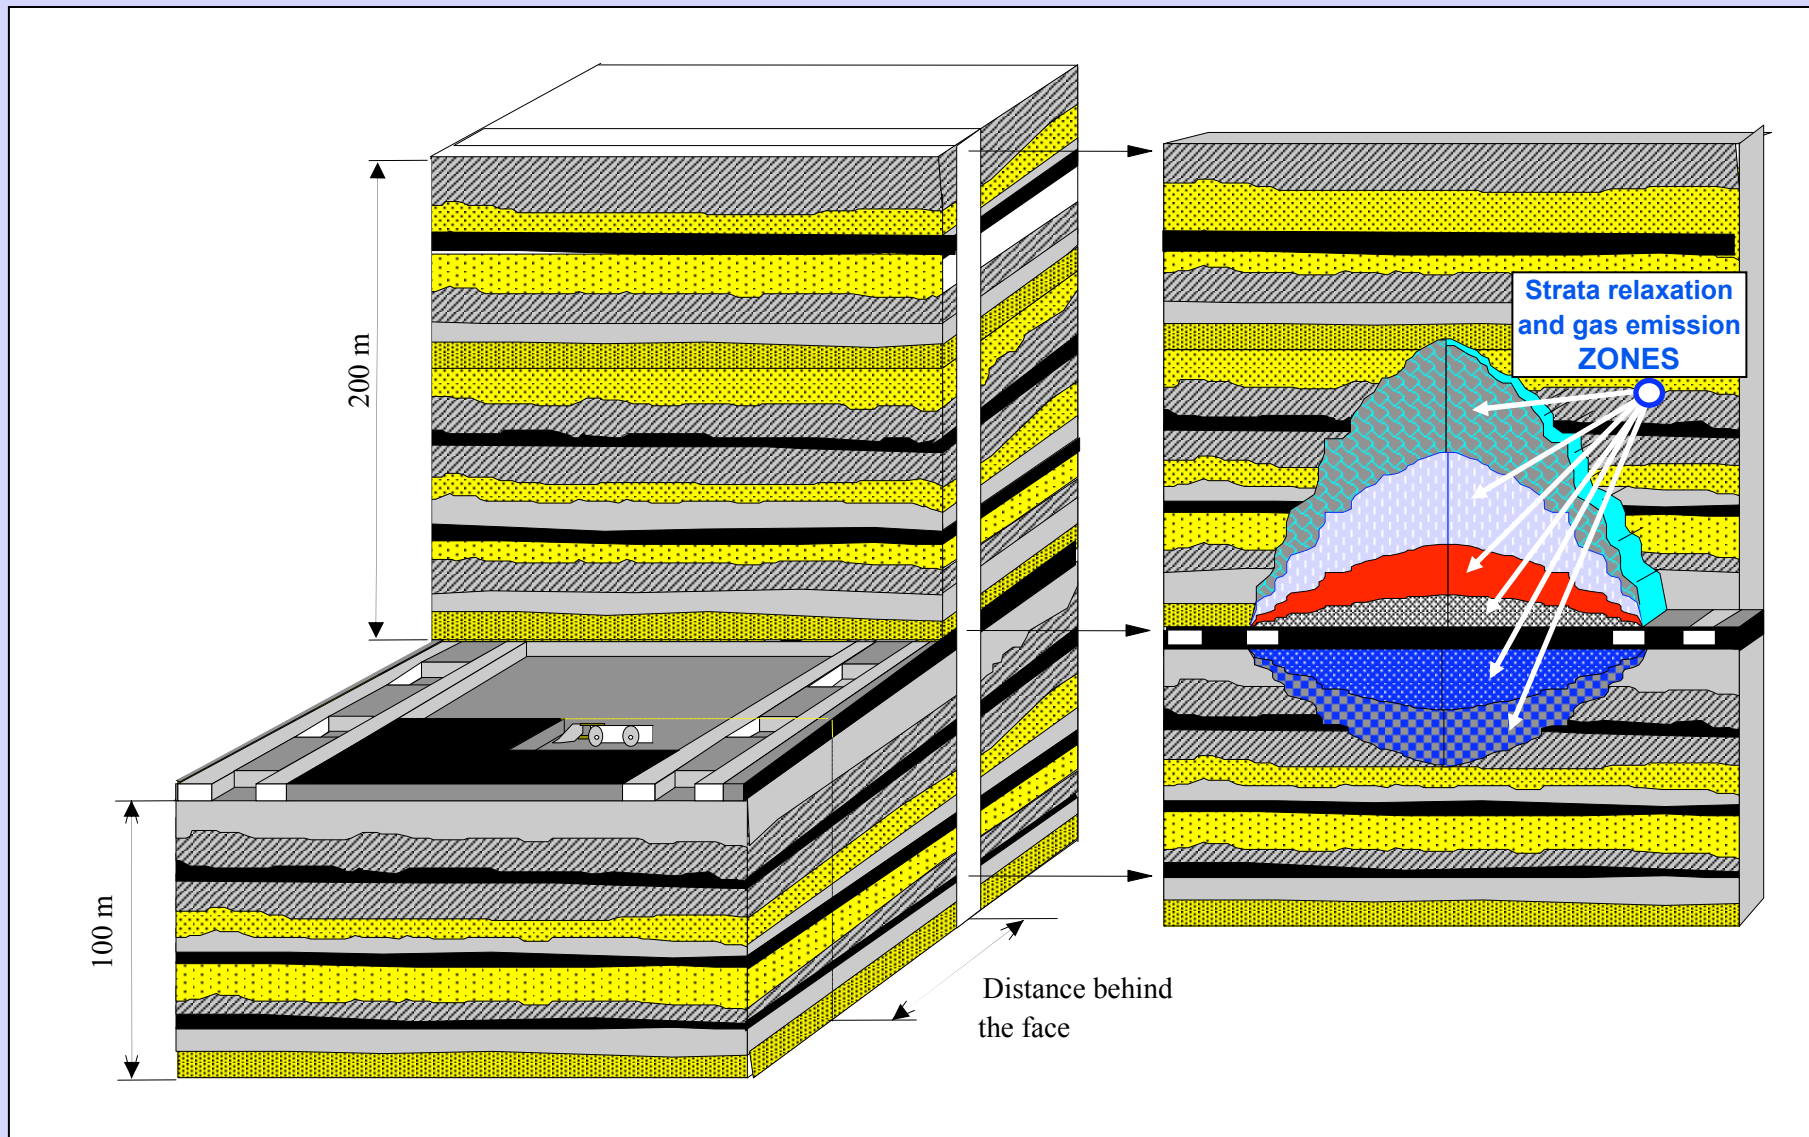

*Example of  
high gassy  
mine  
methane  
emission &  
goaves gas  
decline  
curves  
prediction  
for 20 years*

# *U/G gassy coal mines categories For CMGGP simulation*

$$F(x) = a^* e^{-b*x}$$

Where:

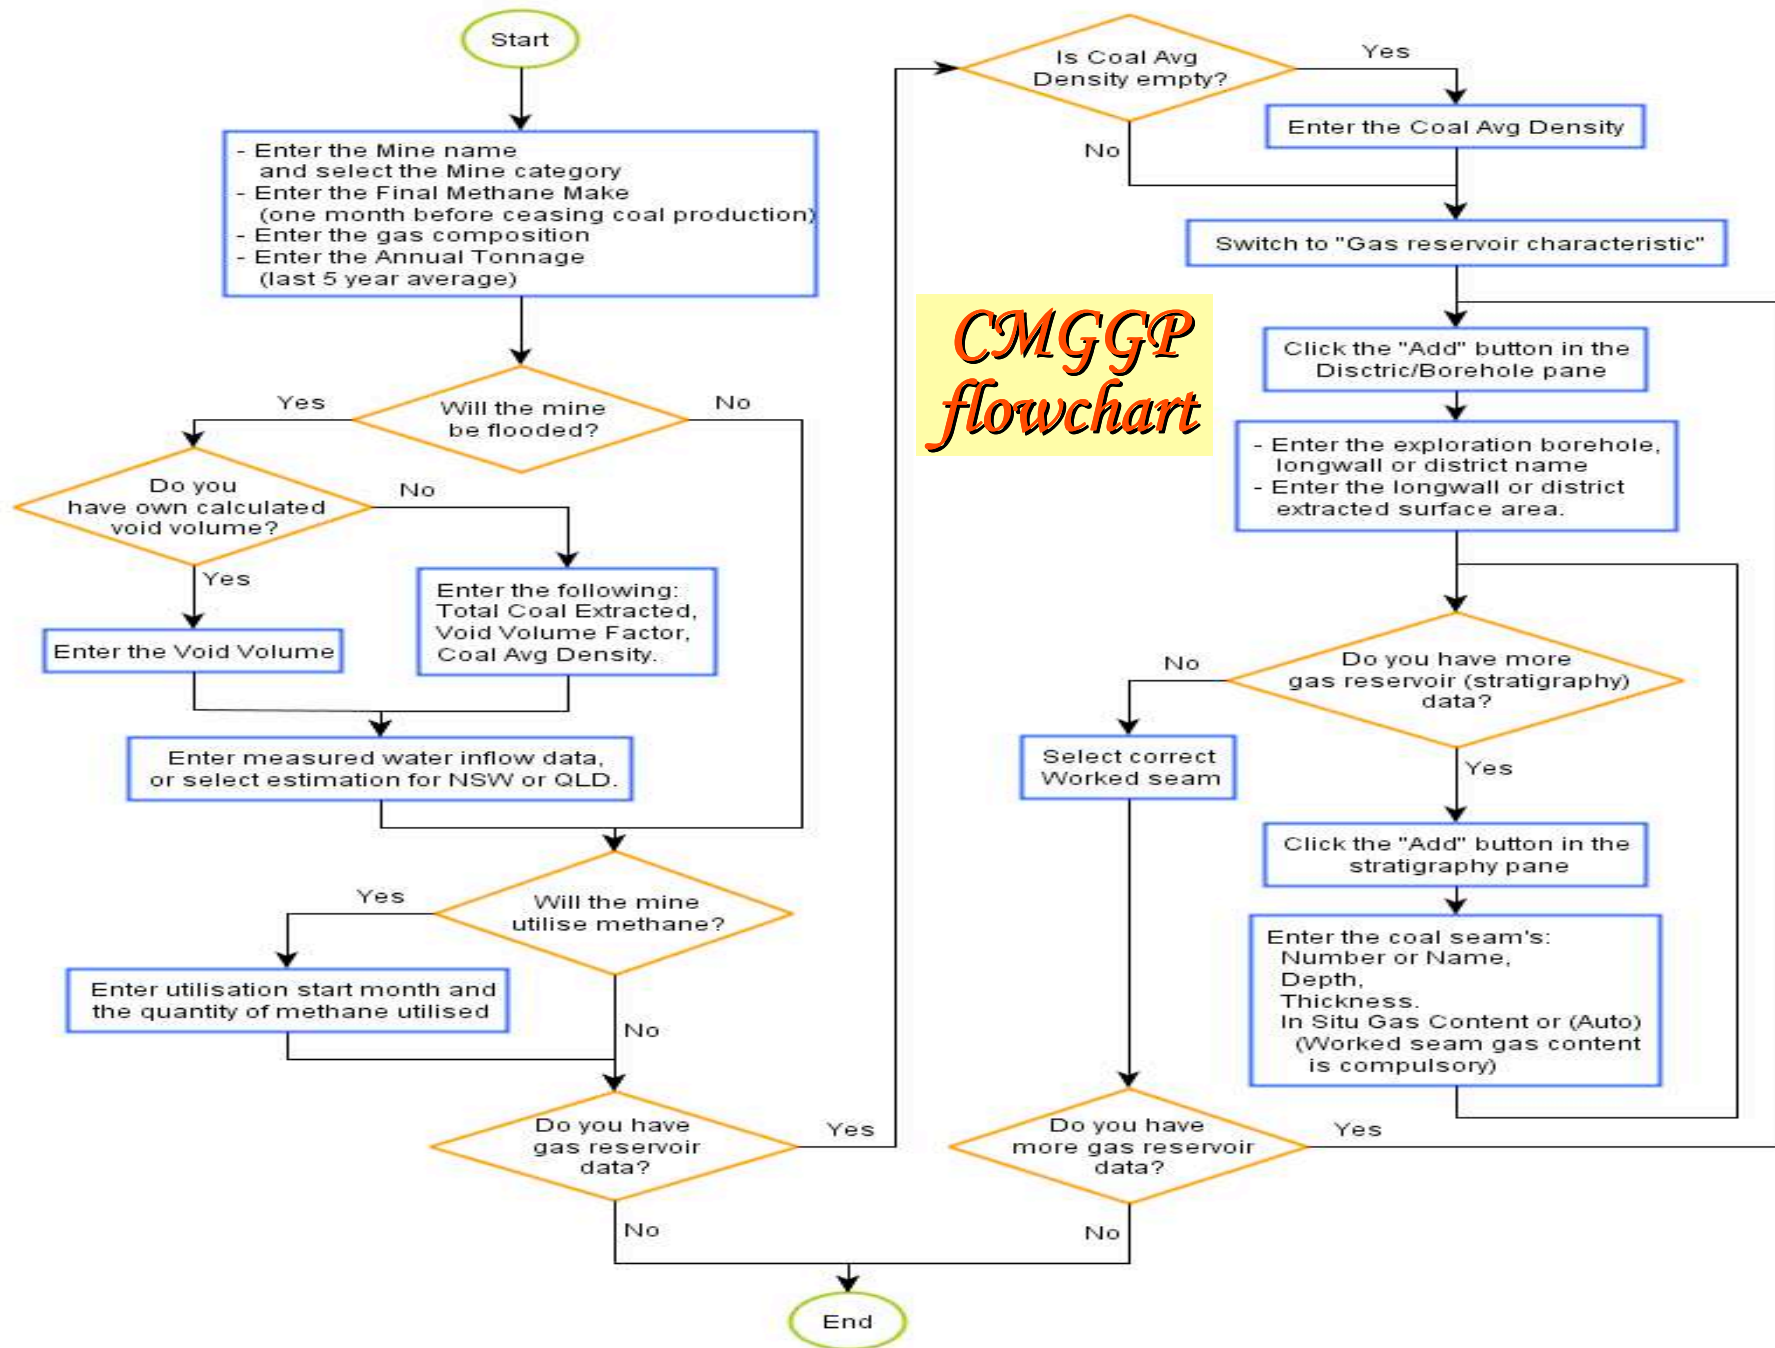

**x** - time (months)

**a** - quantity constant

**b** - decline constant

Category	Description	Coefficient <b>a</b>	Coefficient <b>b</b>
I	High gassy	$a_I$	$b_I$
II	Low gassy	$a_{II}$	$b_{II}$
III	Low permeability	$a_{III}$	$b_{III}$
IV	High permeability or shallow mine	$a_{IV}$	$b_{IV}$
V	Temporary closed	$a_V$	$b_V$
VI	Sealed district goaves	$a_{VI}$	$b_{VI}$
VII	Sealed longwall goaf	$a_{VII}$	$b_{VII}$
VIII	Room & pillar goaf	$a_{VIII}$	$b_{VIII}$
